Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1 and 13, drawn to an apparatus for desorbing only a portion of the sample, classified in class 436, subclass 176.
- II. Claims 2-12, drawn to a TOF mass spectrometry method that requires a vacuum and electric field, classified in class 356, subclass 326.
- III. Claims 14-24, drawn to a mass spectrometer that does not require a laser, classified in class 436, subclass 177.
- IV. Claims 25-31, drawn to a method of surface preparation, classified in class 435, subclass 7.1.

The inventions are distinct, each from the other because of the following reasons:

Inventions I and III are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed does not require the particulars of the subcombination as claimed because the affinity reagent is not required. The subcombination has separate utility such as an affinity binding reaction that specifically binds an analyte of interest.

Inventions I and II are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case, invention II has separate utility such

as an affinity binding reaction that specifically binds an analyte of interest. See MPEP § 806.05(d).

Inventions II and III are related as process and apparatus for its practice. The inventions are distinct if it can be shown that either: (1) the process as claimed can be practiced by another materially different apparatus or by hand, or (2) the apparatus as claimed can be used to practice another and materially different process. (MPEP § 806.05(e)). In this case the process as claimed can be practiced by another and materially different apparatus that requires laser desorption.

Inventions I,II,III and IV are related as subcombinations disclosed as usable together in a single combination. The subcombinations are distinct from each other if they are shown to be separately usable. In the instant case, invention IV has separate utility such as an affinity-binding surface that does not have to be used with a mass spectrometer procedure. See MPEP § 806.05(d).

Because these inventions are distinct for the reasons given above and have acquired a separate status in the art because of their recognized divergent subject matter, restriction for examination purposes as indicated is proper.
